DERBY GROUP · SALES SOURCING FOR THE BANK

STRIDE

Sales in stride. The sourcing CRM: the controls that protect every file, how we measure revenue lost to wrong sourcing, and the reports management can run

Briefing for the CEO · October 2026

IN BRIEF

One system, three outcomes for the business

Control at the point of sale

The bank's product rules are checked while the sales person is still with the customer: the right card for the salary, complete loan details, a manager's approval for exceptions. The tabs the bank issues are on a register of their own, and the business defines who sees what.

Revenue loss made visible

Every card sold below what the customer qualified for is counted in payout lost, by file, by staff member and by team, in the same cycle it happens, visible to the business head and Dubai MIS only.

Reports management can run

Twenty-two reports on sourcing, loans, pipeline, verification, targets, cards, exceptions, incentives for every scheme, profit and loss and access, for any cycle or date range, by region, on screen or as a spreadsheet.

Underneath it all: customer data is masked, watermarked and logged, each role sees only its own region or team, and the whole system runs on our own server with no outside services.

THE NAME

The system has a name of its own: STRIDE. Sales in stride.

A one-word name signals a product the team built, not a tool it was given. A stride is forward motion, rhythm and a bigger step than a walk: the step-change from spreadsheets and MIS cuts to one system. The mark's three chevrons are the pipeline read left to right; the amber one is the step that lands.

S **Sales** · leads, pipeline and conversion

R **Reporting** · dashboards, MIS cuts, P&L

D **Data** · one source of truth for staff and products

T **Tracking** · every file, follow-up and call

I **Incentives** · payouts against the schemes

E **Engagement** · nudges, boosters, the customer journey

IN THE CRM · THE FOOT OF EVERY SCREEN

Navy and amber, deliberately not the bank's colours: STRIDE sits alongside any partner's material without imitating it. The brand appears only here, small and quiet, on every screen in light and dark mode.

THE JOURNEY OF A FILE

Four stages, with a control at each hand-off

1 · SALES

Source the file

Customer, products and loan details captured, region and salary bank recorded; a lead sheet can be scanned to start the file.

2 · RULES

Checked at once

Card eligibility against salary, mandatory loan details, and a manager's approval when a rule is bent.

3 · PROCESSING

Verified by call

A processor confirms every detail with the customer, logs call-backs and sends corrections back to sales.

4 · MANAGEMENT

Measured

Completion, points earned, points lost, deviations and turnaround roll up to team, region and business.

Eight roles

Sales, processing, team leader, ASM, sales manager, MIS, business head and governance, each with its own screens.

Four products, two regions

Credit cards, personal loans, auto loans and accounts, sourced in Dubai and Abu Dhabi.

Built for the sales floor

Works in a phone browser: scan, dictate and submit from the customer's desk, no app to install.

BEFORE THE FILE · LEADS

Every prospect is on record before it is a file, and nothing is retyped when it becomes one

A sales person's own pipeline

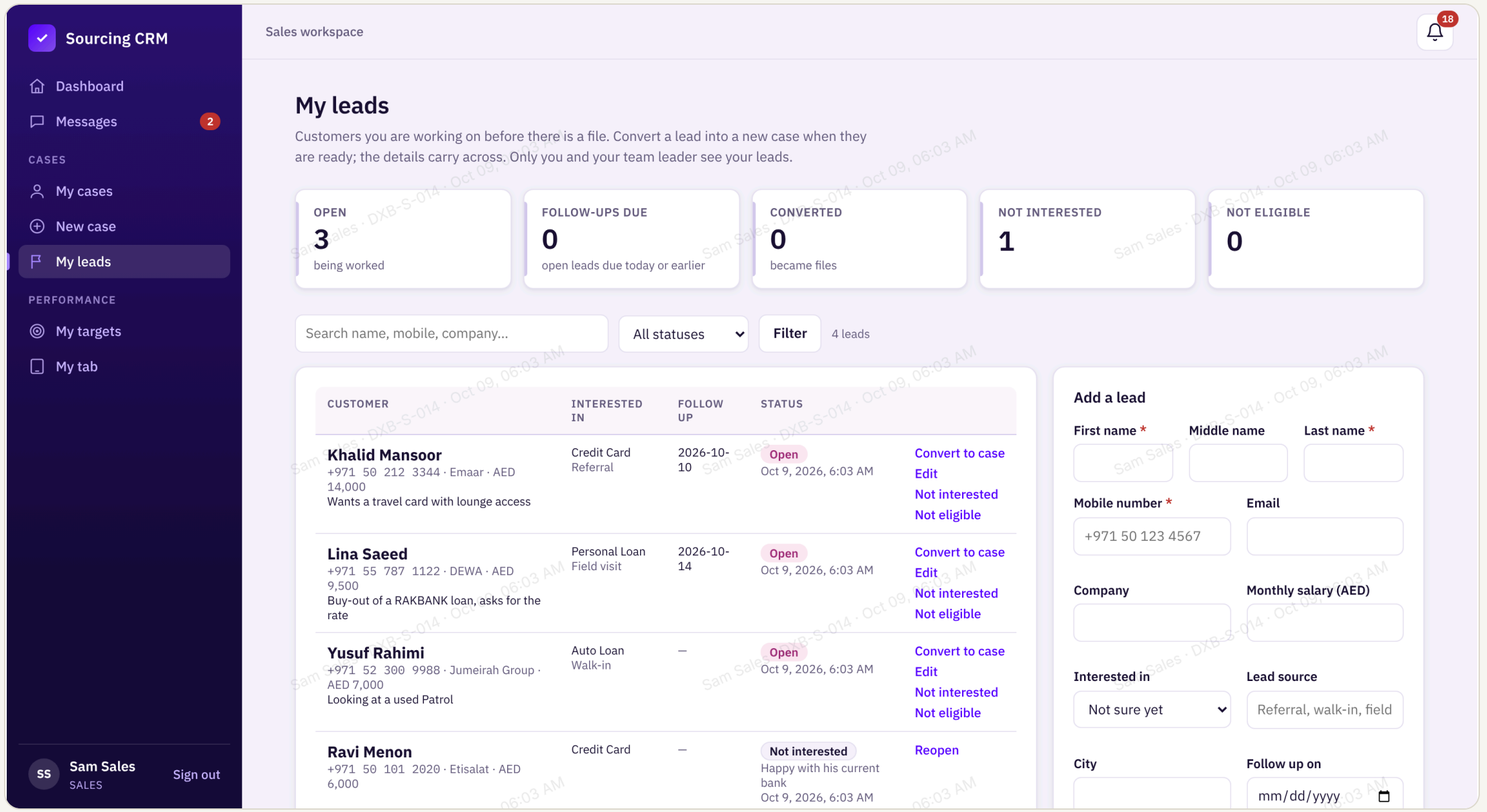

Name, mobile, company, salary, the product of interest, source and a follow-up date. Seen only by the sales person and their team leader; nobody else can open it.

Three ways a lead ends

Converted into a case, with every detail carried into the sourcing form and the lead linked to the file. Or marked not interested, or not eligible, with the reason kept.

Why it matters

Leaders see how much is in the pipeline and what is due today, not just what has been filed. Lost prospects are counted, with reasons, instead of disappearing from a notebook.

BEFORE THE FILE · FOLLOW-UPS

Tomorrow's calls are on the sales person's screen today, with the number one tap away

A date and a time on every lead

Set when the lead is entered, or in one tap on the list. The day before, the lead appears on the dashboard as a task for tomorrow; on the day it moves to today; missed, it turns red as overdue.

From task to call to file

Each task carries the customer's number: a tap asks "Call?" and opens the phone's dialler. A Convert link starts the file with the lead's details already filled in. A lead sheet can be photographed to enter the lead in the first place.

Why it matters

Promised call-backs stop depending on memory. The team leader's dashboard shows the same tasks for the whole team, so a missed day is visible before the customer is lost.

CONTROL 1 · SOURCING

Every file starts complete and correctly identified

What the screen does

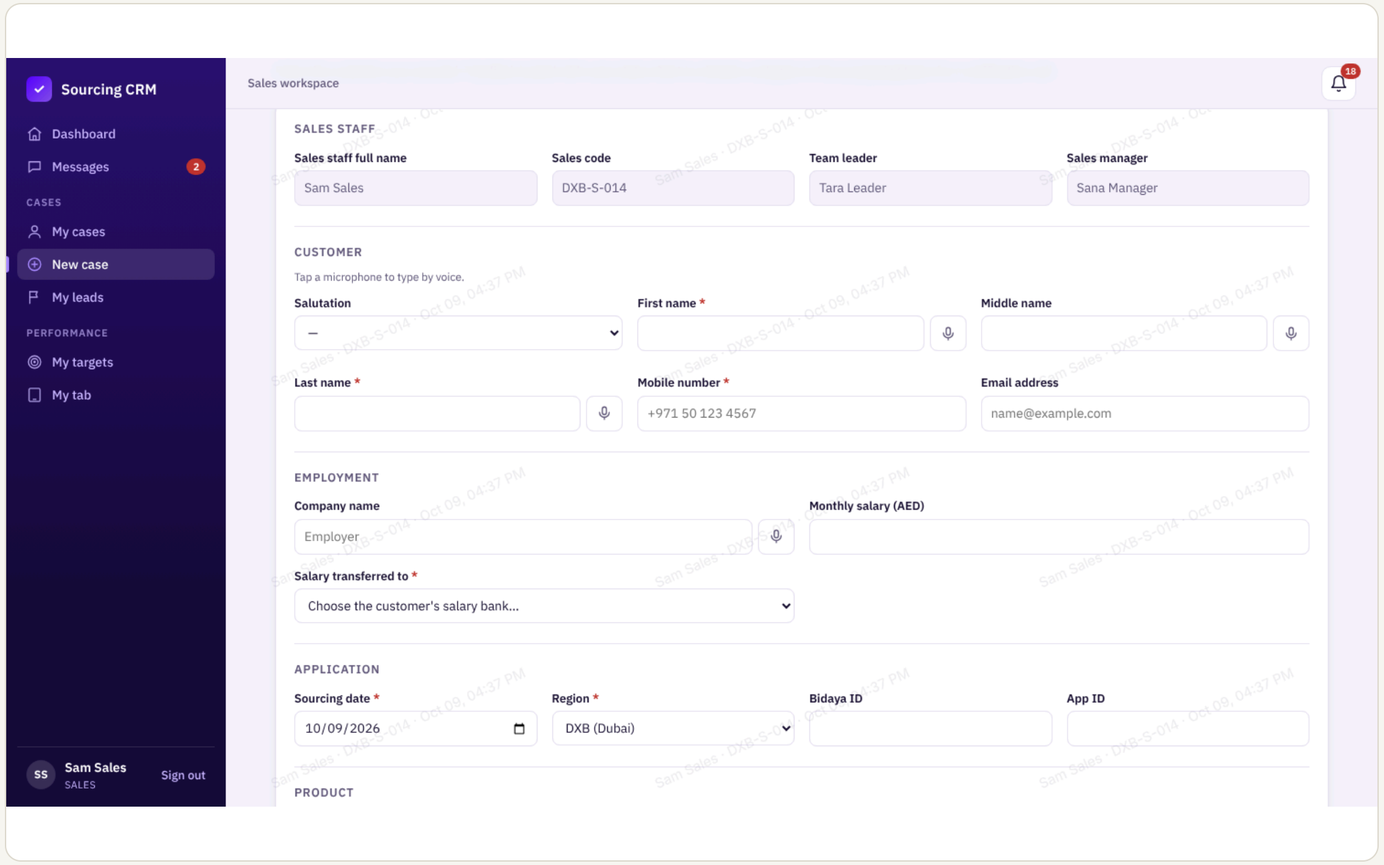

The sales person enters the salutation and names, the mobile number and the product; details can be dictated. Region, products and the customer's salary bank are chosen from lists. No Emirates ID or passport number is ever typed or stored.

Why it matters

A lead can be photographed and converted into the file with the details already filled, so the file matches what the customer gave. Keeping ID numbers out of the system removes the data the business least wants to hold.

What it stops

Incomplete files. Required fields depend on the product, so a card file cannot be sent without a card, salary and fee type, and a loan file cannot be sent without its amount, rate and tenure.

CONTROL 2 · CARD ELIGIBILITY

The right card for the salary, checked while the customer is present

Category and points fill in

Choosing a card from the bank's list of 34 fills its category (Mass, Premium, Super Premium), the salary it needs and the points it earns. Nobody types these.

Salary qualifies for more

If the salary allows a higher category, the form lists those cards and the sales person can switch with one tap. Selling lower is still allowed, but it is recorded as a down-sell.

Salary below the card's minimum

A warning blocks the file unless a reason is given: product deviation or new promotion. The reason is stamped on the file and reported.

CONTROL 3 · MANAGER APPROVAL

No reason given, no verification until a manager decides

The approval queue

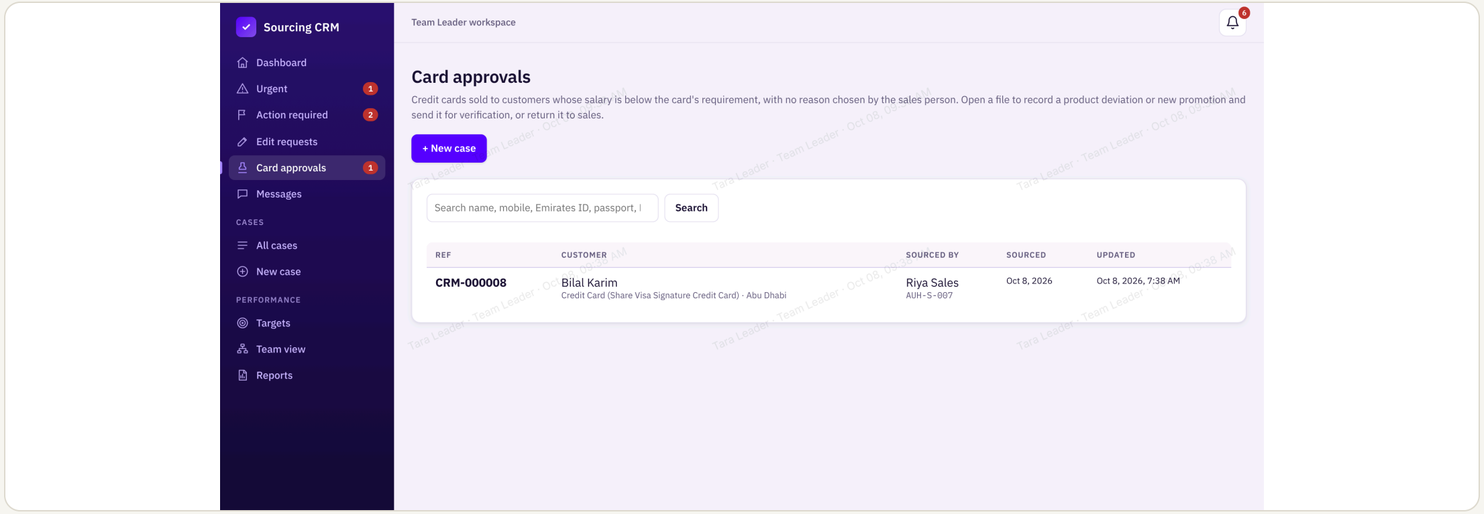

A card file sent below the salary minimum without a reason goes to an Awaiting approval queue for the team leader, ASM or sales manager. Processors cannot pick it up.

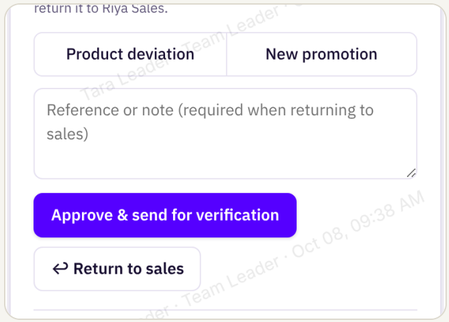

The decision

The manager records the reason (deviation or promotion) and releases the file to verification, or returns it to the sales person with a note. Their name and time are stamped on the file.

Why it matters

Exceptions are decided by a named manager before the file reaches the bank, not discovered in the bank's audit months later.

CONTROL 4 · LOAN DETAILS

Buy-outs and auto loans cannot be submitted half-described

Personal loans

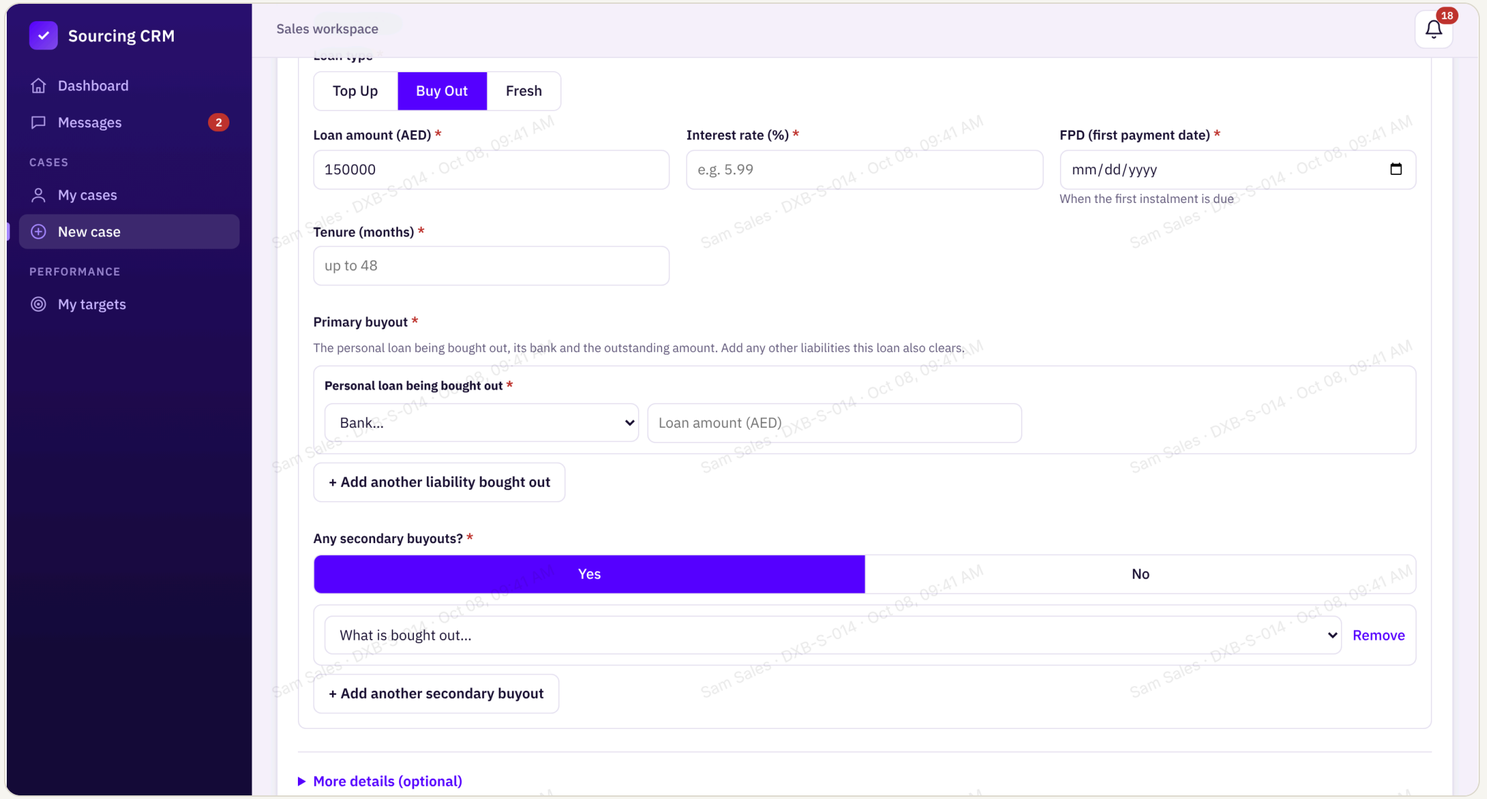

Fresh, top-up or buy-out, with tenure capped at 48 months. A buy-out must name the personal loan being bought, its bank and amount. Every loan confirms whether there are secondary buy-outs: cards with limits and banks, non-STL loans, auto loans or mortgages.

Auto loans

New or used, car make, model and year, dealer, lead source, rate of interest and tenure up to 60 months.

Why it matters

The bank's liability picture is complete on day one, and the reports can show which banks we are buying out and where auto loan leads come from.

CONTROL 5 · VERIFICATION

A second person confirms every detail with the customer

What the processor does

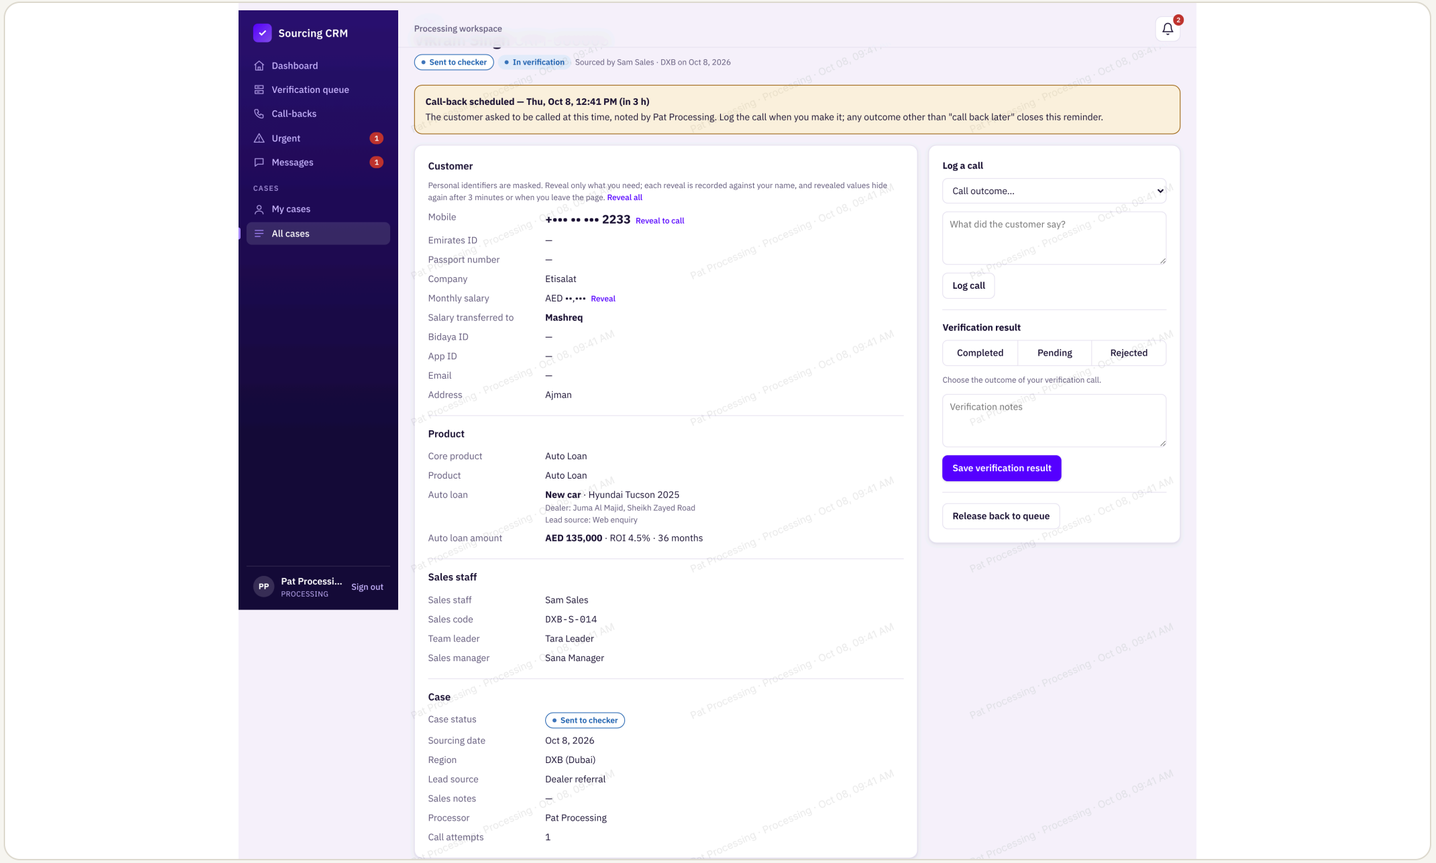

Picks the file from the region's queue, calls the customer, reveals the phone number only to dial, and confirms the salary, employer, product and amounts. Each call is logged with its outcome.

When something is wrong

No answer: a call-back is scheduled and chased. A mismatch: the file goes back to the sales person with a note, is corrected, and returns for re-verification.

The outcome

Completed, pending or rejected, with notes. Nothing reaches the bank unverified, and the verification report shows each processor's calls, call-backs and turnaround.

VERIFICATION · DO NOT CALL REGISTER

A customer we cannot call gets a ready-made email asking for permission

The file stops, the email is drafted

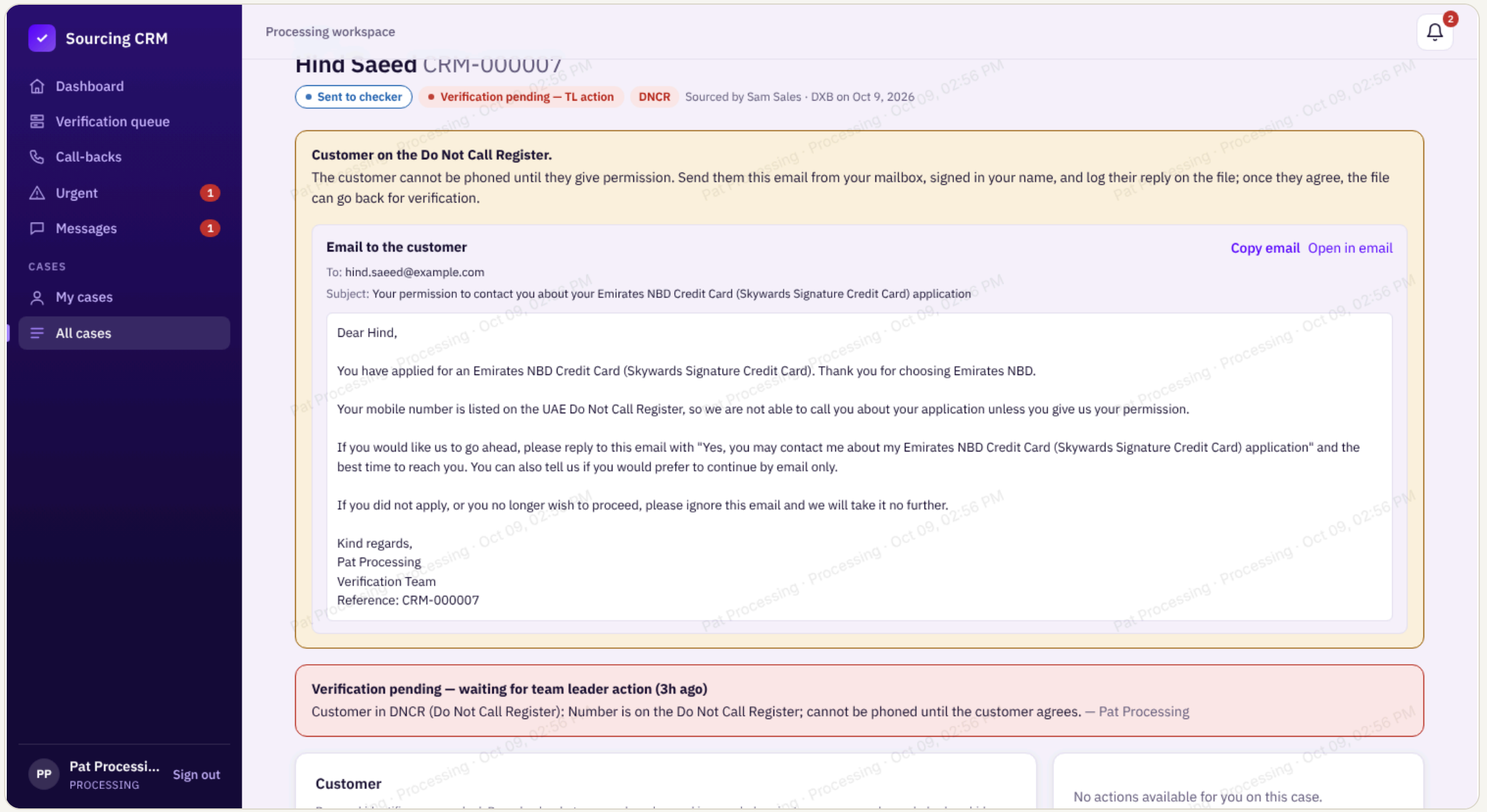

When the processor marks a customer as being on the UAE Do Not Call Register, the file waits and the CRM drafts the email itself: the customer's name, the Emirates NBD product they applied for, and the exact reply that gives permission.

Sent by the right person

Only the processing team or the team leader see the draft, signed in their own name. Copy it or open it in the mailbox in one click. The sales person is never the one contacting a customer on the register.

Why it matters

No call is made without consent, the wording is the same every time, and the file carries the reference so the customer's reply can be logged and the file sent back for verification.

VERIFICATION · CONTROLS

Files that need a second look wait for the right person

Approval before verification

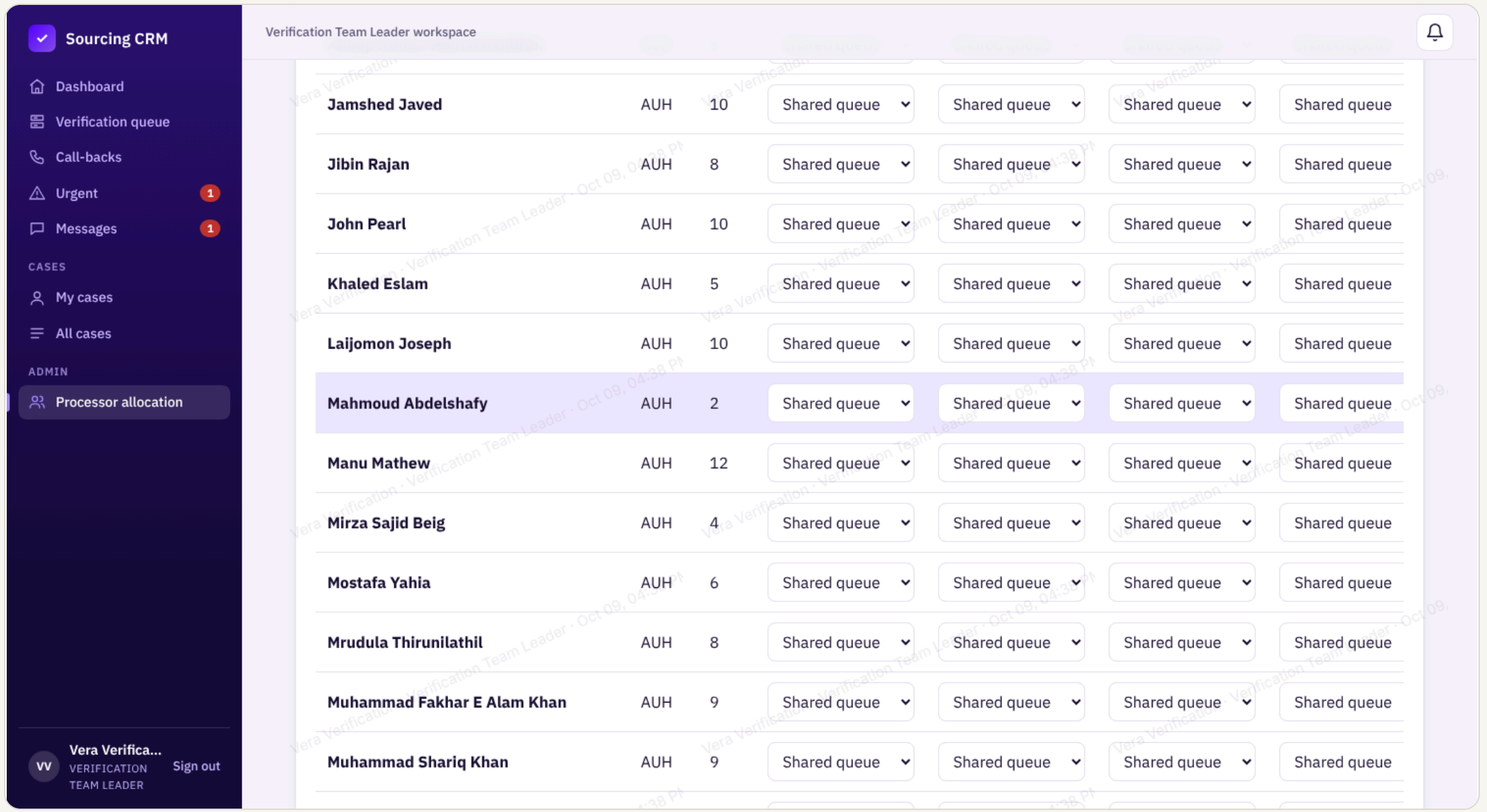

A file sourced on a Sunday or entered after 6 pm is flagged and waits for the team leader or sales manager. A card sold below its salary requirement waits for the same decision. Nothing reaches a processor until the team has said yes.

The right processor, per product

The verification team leader allocates processors to each sales team leader by product: cards to one, loans to another, or all to one. A routed file reaches only its processor's queue.

Honest outcomes

A processor who cannot reach the customer can still complete on a deviation, with a mandatory reason on the file. Governance marks each complaint valid or invalid, and a valid complaint removes the file from the sales person's incentive.

VERIFICATION · AI

A verification bot that calls the customer, taught and approved by our own people

A bot that makes the verification call

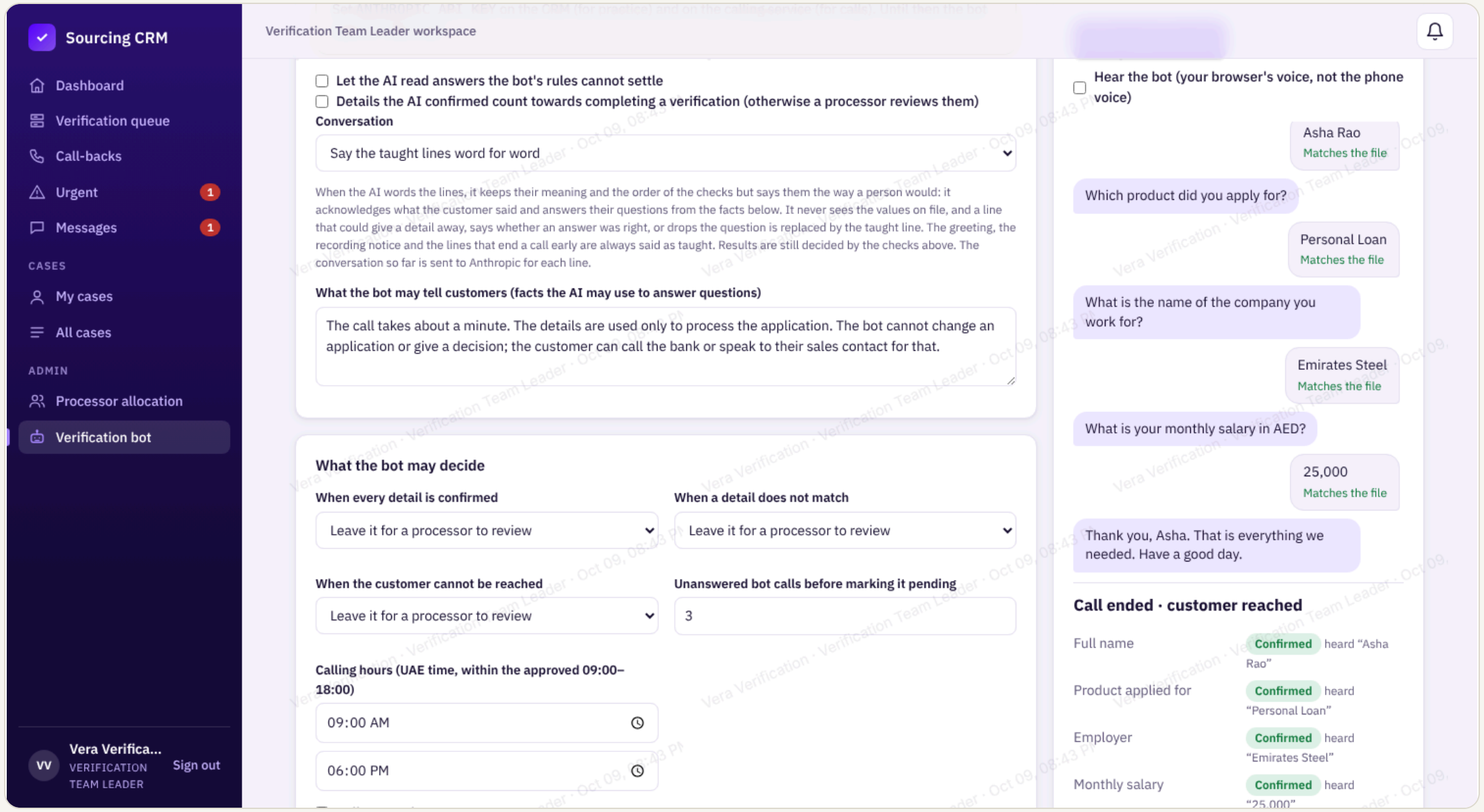

It phones the customer, checks it is speaking to them, and asks one question per detail: name, product, employer, salary. Every line it says is taught on one page, and a practice panel plays the call before anything is saved.

Claude behind it, within limits

The AI reads only the answers the rules cannot settle, such as "twenty-five K" or "the national oil company", and can word the conversation naturally. It never reads a customer's details back, and it never rejects a file.

People stay in charge

The verification team leader asks for each call; governance and a business head both approve; calls go out only between 09:00 and 18:00. By default the bot decides nothing and a processor reviews the result; the business can allow it to complete a fully confirmed verification.

VERIFICATION · ON OUR OWN LINE

The bot can call from our own SIP line, with nothing leaving our server

No telephony provider in the call

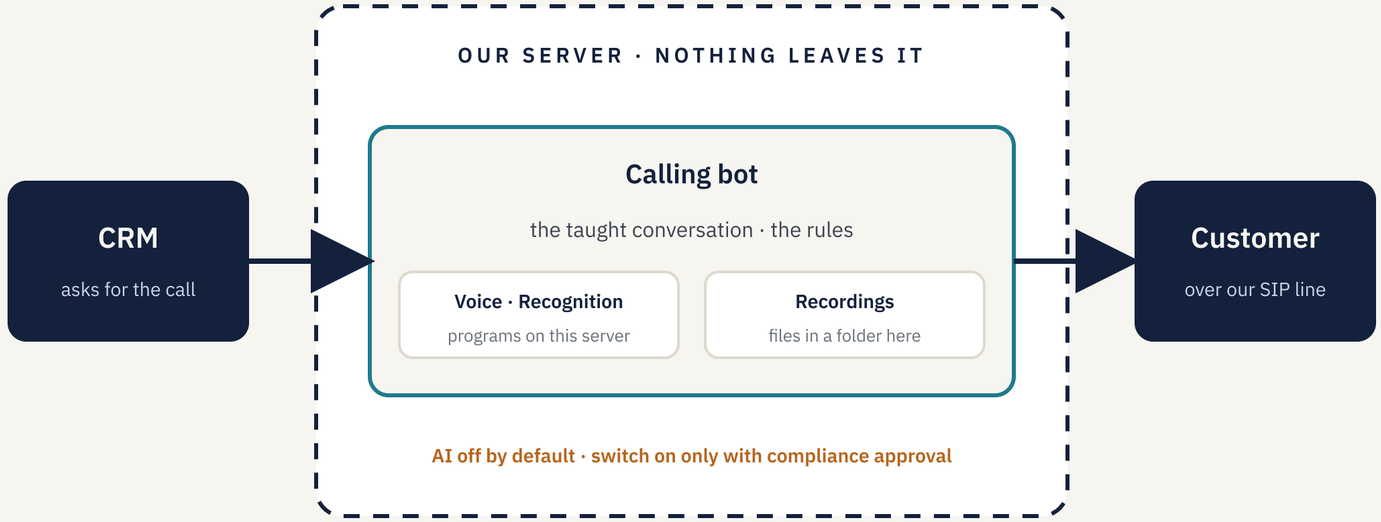

A second calling service dials over the company's own SIP line from a server we control. The customer sees our number; no cloud telephony company carries the call or sees the customer's details.

Speech and recordings stay on the server

The bot's voice and the recognition of what the customer says are open-source programs installed on that server. Recordings are files in a folder there, played inside the CRM with a signed request. Nobody outside hears or stores a call.

Same bot, same controls

The CRM cannot tell the two services apart: the same requests, two approvals, calling hours, taught lines, results and transcripts. The AI is off unless we switch it on, so by default the whole call stays in-house. A one-command check tests the line and places a test call before go-live.

```
$ node bot/sip-check.js --call 050 123 4567
Speech engines
  ✓ Voice: produced 4.1 s of audio in 310 ms
  ✓ Recognition: heard "this is a test call from the verification bot…" in 1.2 s
SIP line
  ✓ Registered as our number with the provider
Test call
  ✓ Answered after 4.6 s · said the test line · audio came back · hung up
All checks passed.
```

VERIFICATION · CALL LOOKUP AND RATING

Every call to a customer can be found, heard and rated inside the CRM, but only after the approvals

Approvals first

Nothing opens on its own. Governance requests the call recording on the file with the reason, once verification has a final result. The business head approves. Only then can the calls be looked up, heard or rated; the API refuses before that, whoever asks.

Every call for the number

One button on the file asks our recording server for every call to or from the customer's numbers: when, which way, how long, which extension, with a player. The bot's own calls to the same customer are listed with them. Lookups and listens go to the access log.

Governance rates what it hears

Each call gets a score out of 10 and a note, kept on the file's history and revisable. The recording server's address, credentials and audio never reach the browser: the CRM fetches the audio itself and the link carries no part of the number.

Calls to this customer · CRM-000142 · approved by the business head

WHEN	DIRECTION	LENGTH	EXTENSION	RECORDING	RATING
7 Oct 2026, 09:30	Outbound	4:12	204 · Pat	▶ Play	8/10 Gina · rate explained, tenure not
5 Oct 2026, 14:15	Inbound	1:48	201	▶ Play	Not rated
5 Oct 2026, 11:02	Outbound	3:05	Verification bot	▶ Play	9/10

CONTROL 6 · CUSTOMER DATA

Once a file is submitted, sales staff cannot take the customer's data with them

Hidden and masked

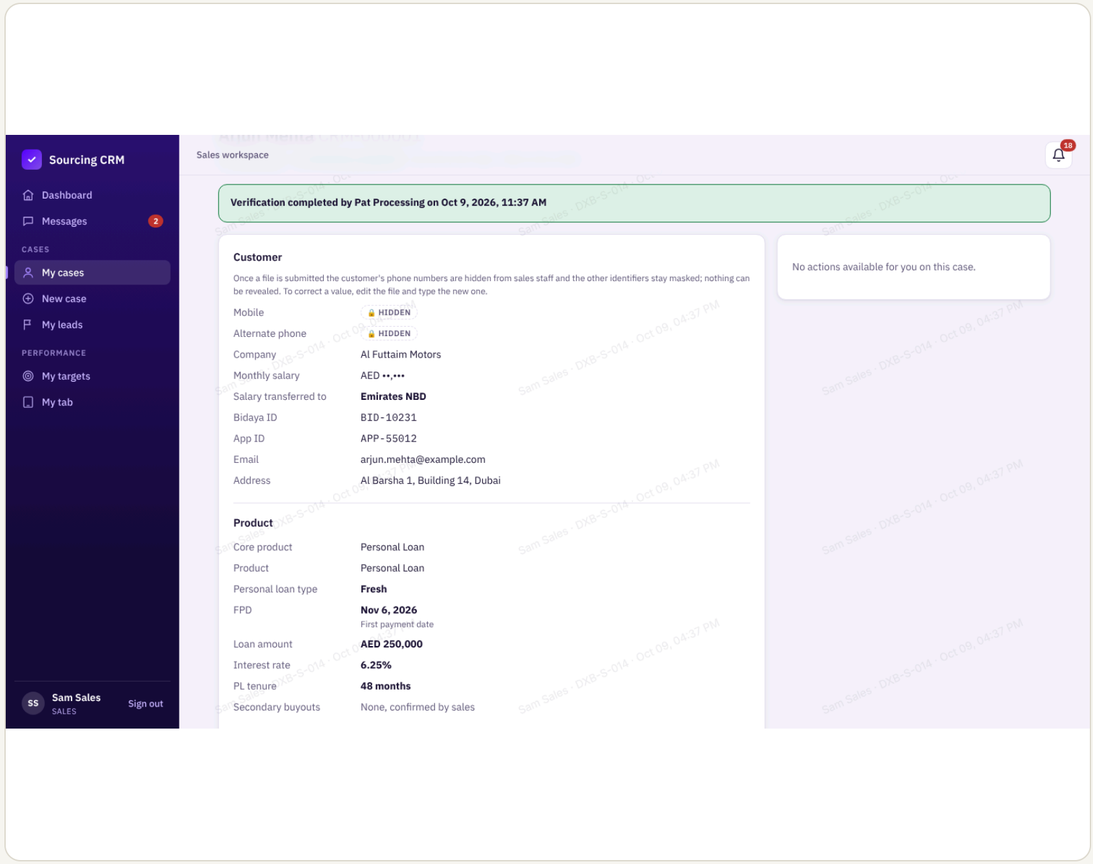

The sales person sees the customer's phone numbers as Hidden and the salary only as a mask, with no way to reveal them. Processors and managers reveal only what they need, and each reveal is logged. Emirates ID and passport numbers are not kept at all.

Watermarked

Every screen carries a faint watermark of the signed-in user and the time, so a photo or screenshot can be traced to its source. Uploaded documents are stamped the same way.

Why it matters

The bank's customers' data stays inside the file. A leaver takes no phone list, and the governance team can answer "who looked at this customer" from the log.

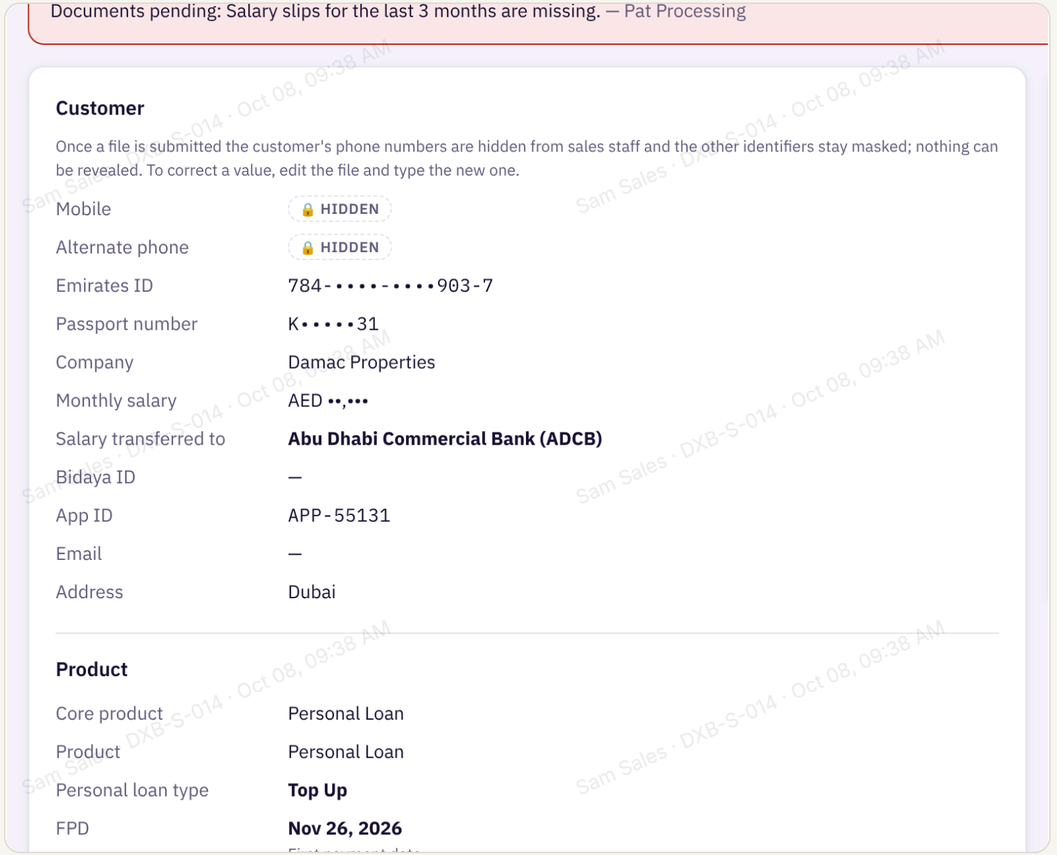

CONTROL 7 · WHO SEES WHAT

Each role sees its own slice, and every file says who can read it

Role	Files visible
Sales staff	Their own files only
Processing	Their own region, Dubai or Abu Dhabi
Team leader, ASM, sales manager	Files of staff in their own team
MIS, business head, governance	Everything, with a region switch

> When a staff member changes team, open files move with them for the cycle; completed files stay credited to the old team. The Discussion on every file lists exactly who can read and post, so nothing is said to an audience nobody expected.

CONTROL 8 · TAB REGISTER

Every sourcing tab the bank issues is accounted for, by an IT role that sees nothing else

What is recorded

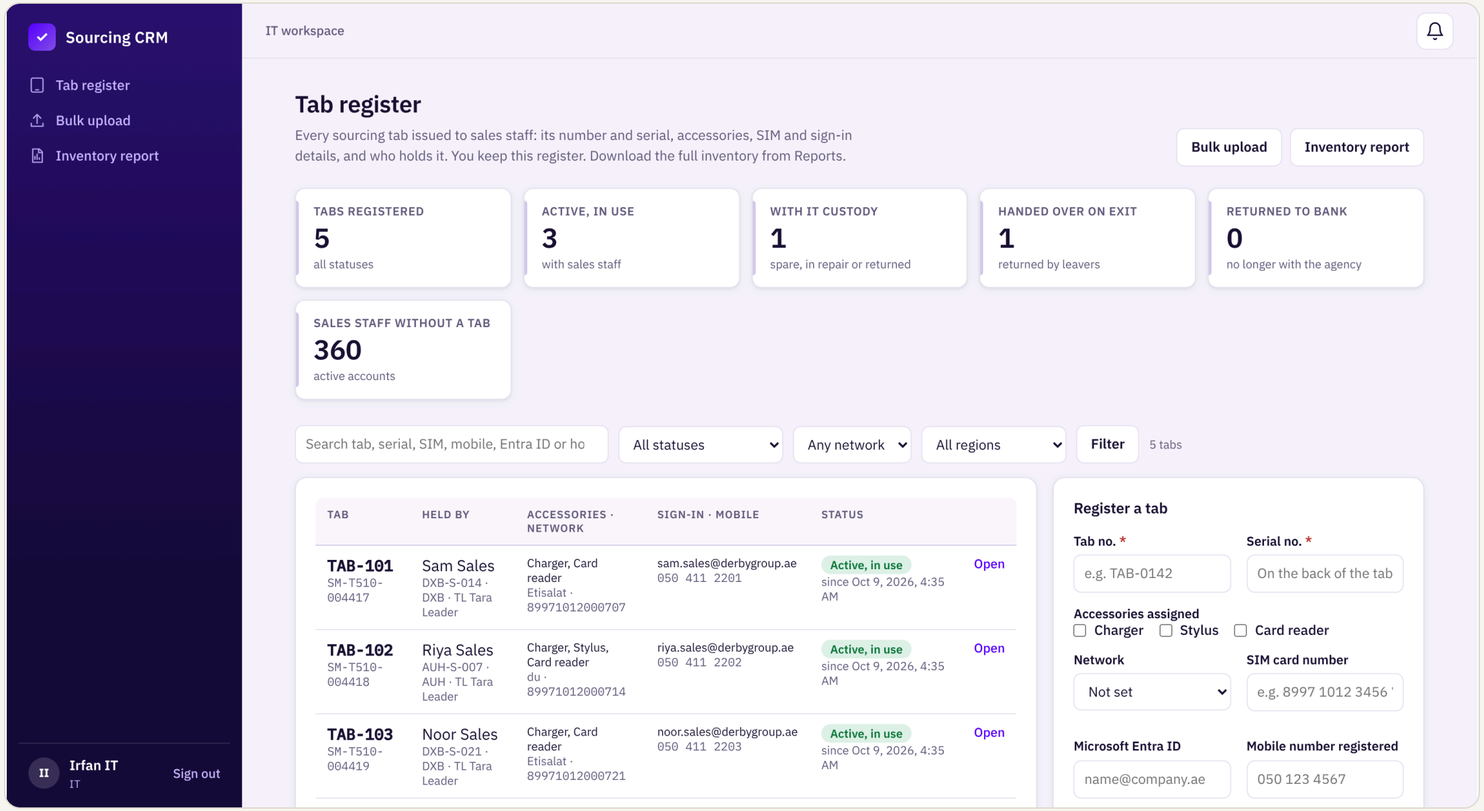

Per tab: serial and tab numbers, the charger, stylus and card reader issued with it, Etisalat or du SIM and number, the Microsoft Entra ID and the registered mobile. One tab per sales person, shown on their own dashboard.

Custody at all times

Active in use, with IT custody, handed over on exit, or returned to the bank on a dated record. Every move is logged with who did it. Tabs can be loaded in bulk from a sheet.

Why it matters

The IT department keeps the register from its own account, with no access to customer files. An inventory report can be pulled at any time for the bank or an audit, with the leavers' tabs and spares counted.

Access is defined by the business, not hard-wired: a role gets only what it is given

Nine built-in roles

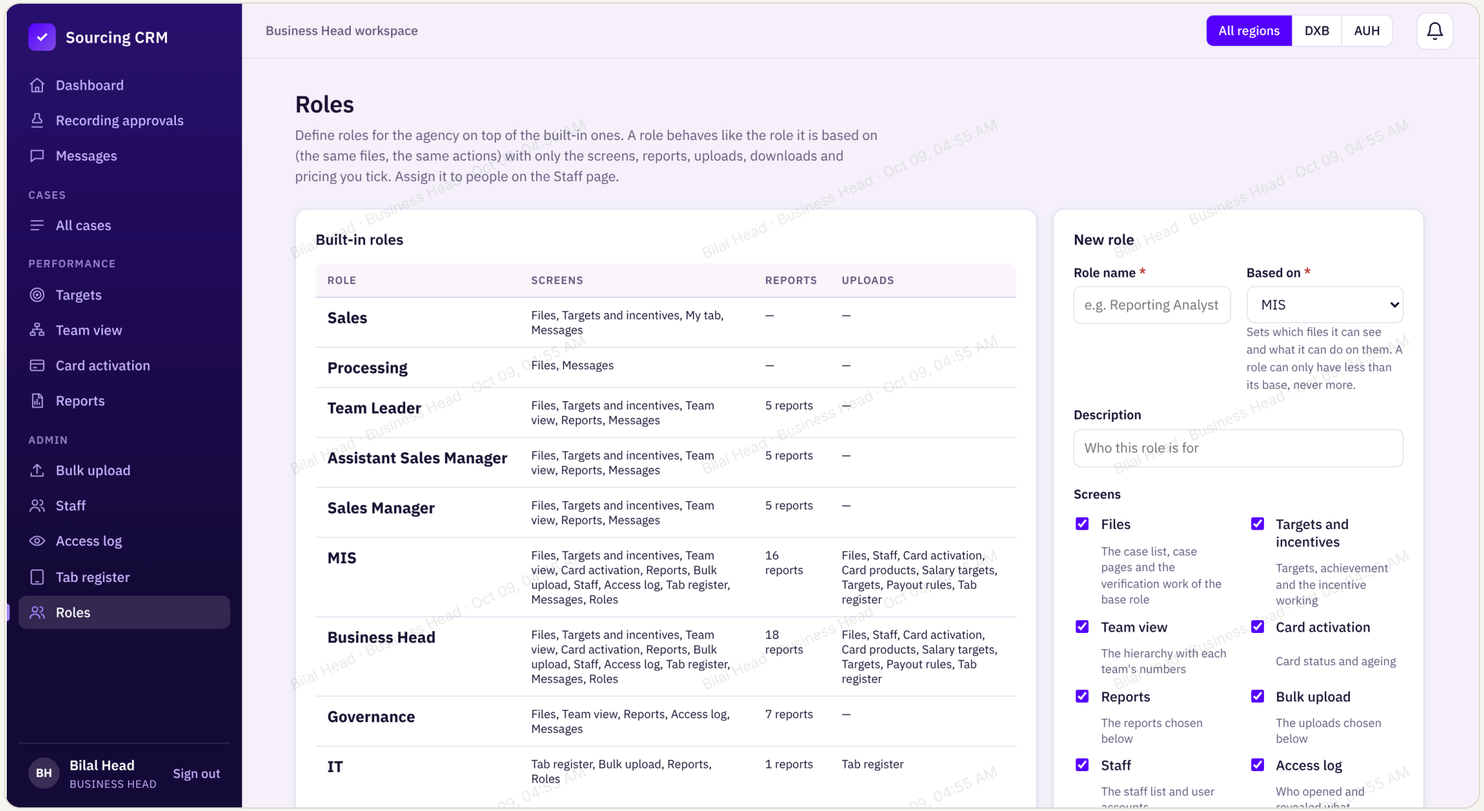

Sales, processing, team leader, ASM, sales manager, MIS, business head, governance and IT, each with its own screens, reports and uploads. These cannot be widened.

Roles the agency defines

IT, Dubai MIS and business heads build a role on a built-in one and tick what it gets: which screens, which reports, which uploads, whether it can download, whether it sees pricing. Never more than its base.

Why it matters

An auditor, an analyst or a bank visitor can be given exactly the view they need, and nothing else, without a code change. Every refusal is enforced on the server, not just hidden on screen.

REVENUE LOSS FROM WRONG SOURCING

Every card has a payout, so every wrong card has a cost in dirhams

PAYOUT POSSIBLE
What the bank pays for the best card the customer's salary qualified for.

−

PAYOUT EARNED
What the bank pays for the card actually sold.

=

PAYOUT LOST
Revenue left on the table by that file, attributed to the sales person, team leader and manager.

Sample cycle · cards sold below eligibility
7 files

Payout possible
AED 17,600

Payout earned
AED 13,400

Payout lost · 24% of what was possible
AED 4,200

A Mass card sold to a customer who qualified for Super Premium costs AED 1,200 of payout and 400 points; a Premium card in the same case, AED 600 and 250 points. Figures above are the demo's sample data for one cycle. Deviations below the salary minimum are the second loss: effort the bank may decline, reported separately.

REVENUE · THE BANK'S PAYOUT ON EVERY FILE

Every file shows what it earns, from the bank's own rates

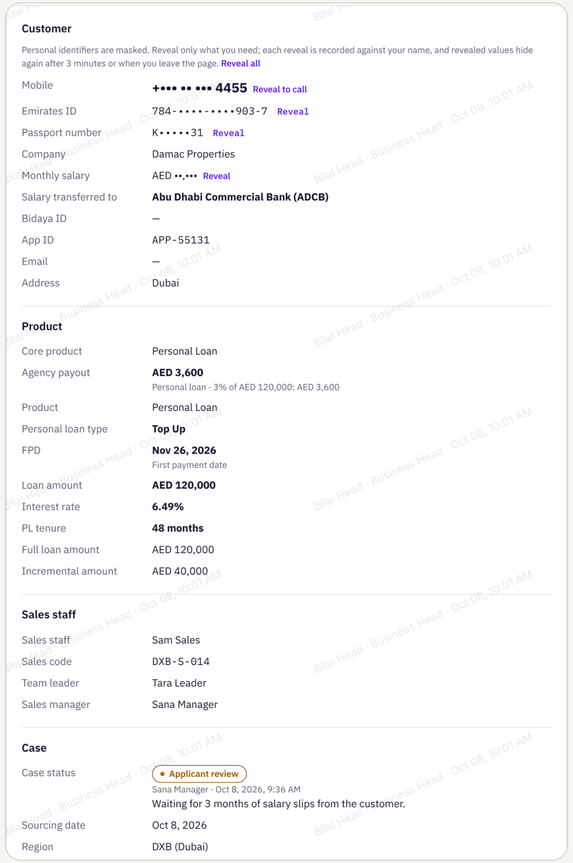

Product	Bank payout
Mass card	AED 1,400 per card (noon One: AED 1,100)
Premium card	AED 2,000 per card
Super Premium card	AED 2,600 per card
Personal loan	3% of the amount disbursed
Personal loan buying out Emirates Islamic	1.5% of the amount
Auto loan, used car	1.75% of the amount
Auto loan, new car	0.70% of the amount

Where it shows

On each file, with the working. On the dashboard as payout earned this cycle and payout in the open pipeline. In the sourcing report per staff member, in the case register per file, and in the down-sell report as payout lost.

Who sees it

Only the business head and the Dubai MIS team. Sales staff, processors, team leaders, sales managers, ASMs and governance never see what a file earns, and the rates themselves are visible and changeable only to those two.

REVENUE LOSS · THE REPORT

Cards sold below eligibility, with the payout lost on each

Cards sold below eligibility

2 files										**0 deviations · 1 promotions · 1 awaiting**					

What it lists

Every card sold below the salary the bank requires, the reason recorded, and who approved it.

What it tells us

How much of our card volume depends on exceptions, by team and by approver, and how many files are still waiting on a decision.

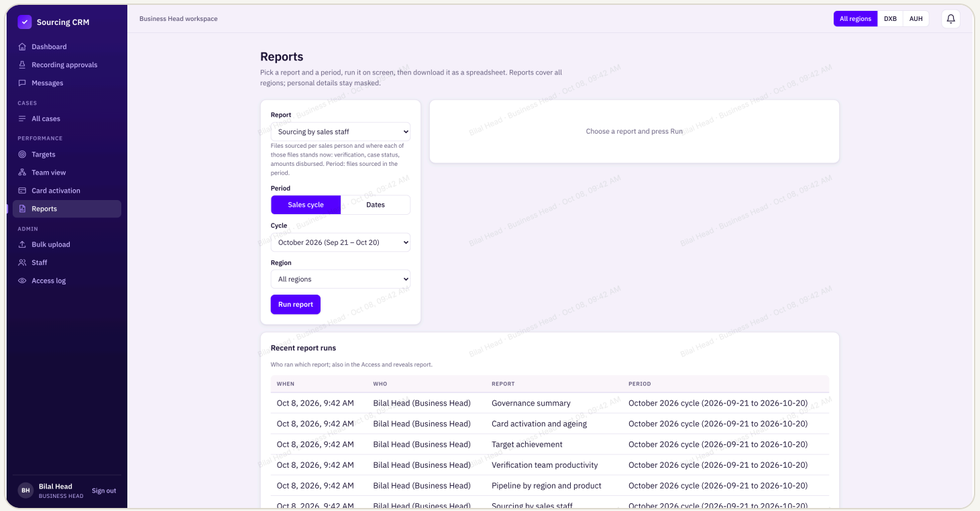

The conversation with the bank

When promotions change or deviations are questioned, we have the list, the dates and the names.

REPORTS FOR MANAGEMENT

Ten reports, run by management without asking anyone

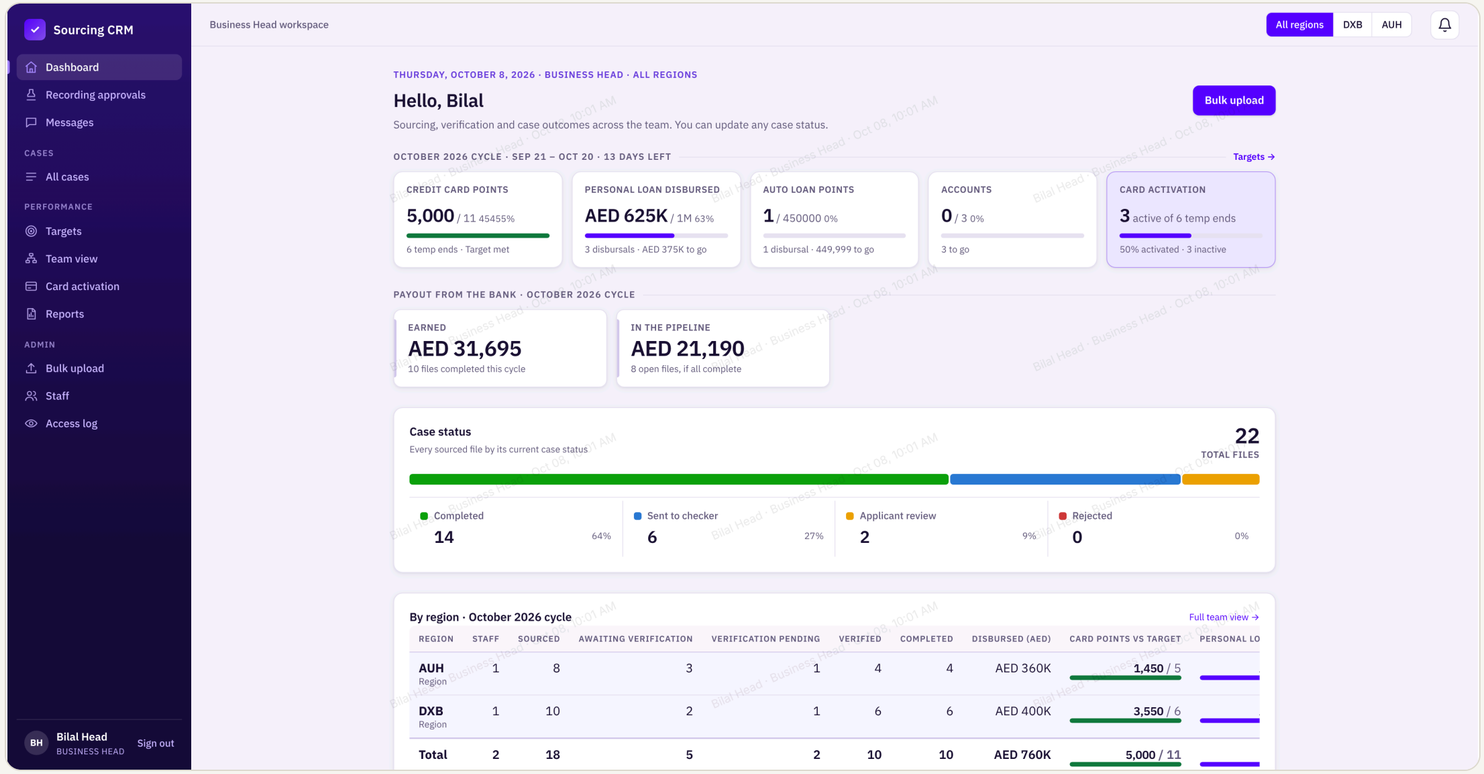

Report	What it answers
Sourcing	Files sourced per staff, team and product, with deviations and down-sells
Pipeline	Where every open file sits and for how long
Verification	Calls, call-backs, corrections and turnaround per processor
Targets	Target against achievement per staff member for the cycle
Cards	Cards sold by family, category and activation
Card deviations	Cards sold below the salary rule, with reason and approver
Cards below eligibility	Down-sells with points earned, possible and lost
Governance	Rejections, re-verifications and exceptions by team
Access log	Who viewed, revealed or exported which customer's data
Case register	One row per file for the period, personal data masked

> Any sales cycle or date range, one region or both, on screen or as a spreadsheet. Every run is logged with who ran it and when. Managers run the reports for their own teams; MIS, the business head and governance for the whole business.

DASHBOARD

The business head opens to the whole business, or one region

Region switch

All regions, Dubai or Abu Dhabi, at the top of every page. It applies to the dashboard, the case list, the team view and every report.

Cycle at a glance

Targets against achievement per product, payout earned this cycle and what the open pipeline would earn, files by status, and the same by region.

Role-shaped

A sales person sees their own files and target; a processor the region's queue; a team leader the team. Same home page, different tiles.

MANAGEMENT · MIX

How much of each product the core team brings in, and how much is cross-sold

One bar per product

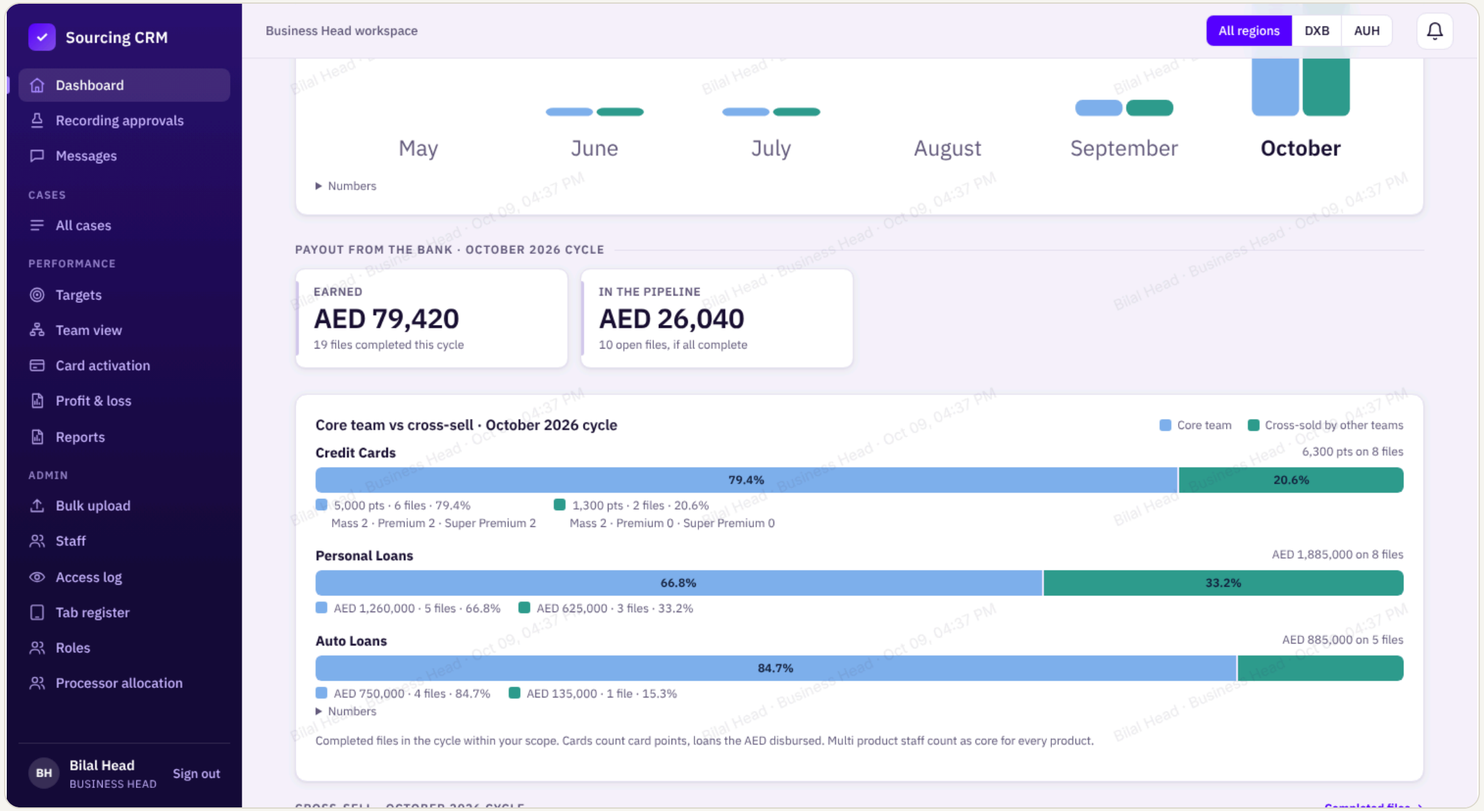

Credit cards in card points, personal loans and auto loans in dirhams disbursed, split between the core team and what other teams cross-sold, with the amounts, file counts and shares on the bar.

Cards by category

Under the card bar, how many Mass, Premium and Super Premium cards each side sold, since the mix decides the incentive rate.

Why it matters

Cross-sell is paid for separately in every scheme. The business head sees at a glance whether loans are coming from loan teams or riding on card sales, and where a push is needed.

Every loan book is priced against the 8.49% minimum, from each sales person up to the region

What yield means here

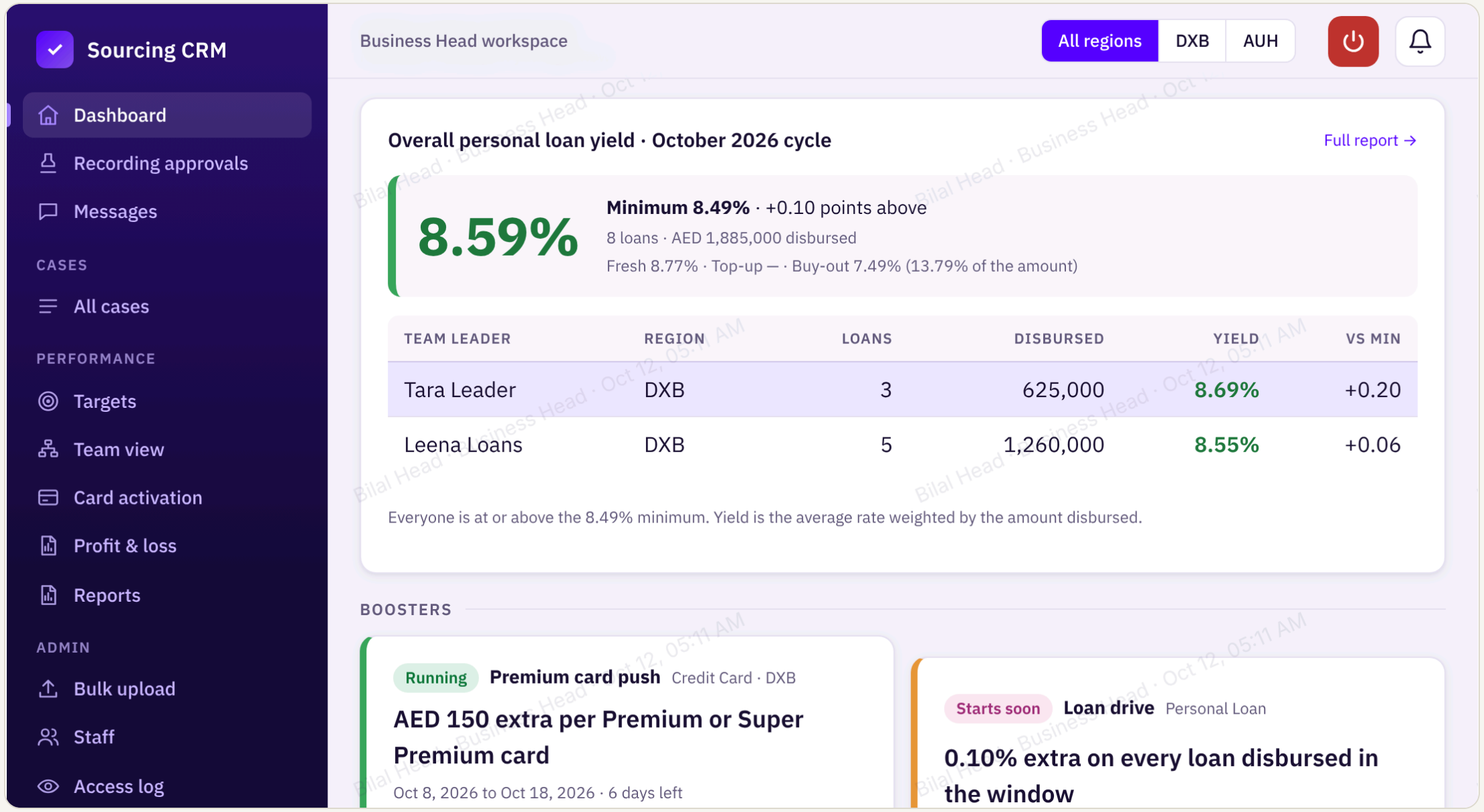

The average interest rate on the personal loans disbursed in the cycle, weighted by amount, so a large loan at a low rate pulls the figure down as it should. Only disbursed loans count, at the amount disbursed and the rate on the file.

One minimum, every level

8.49% is the floor. Each sales person sees their own yield; a team leader sees the team and each member; managers see their team leaders; the business head sees the regions. Green at or above the minimum, red below, with the gap in points and the split by fresh, top-up and buy-out.

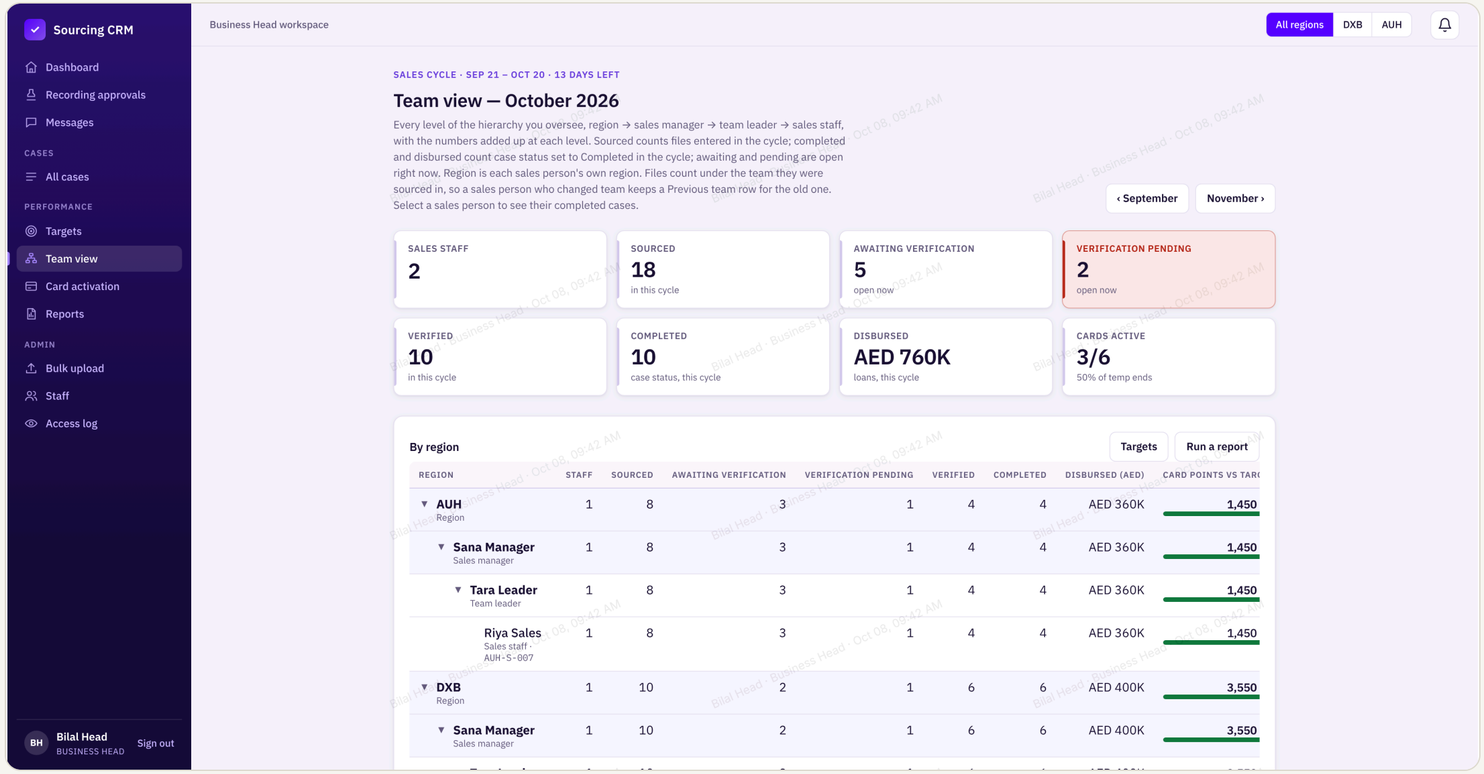

Why it matters

Volume alone can hide a book sold too cheap. The buy-out share shows where the rate is coming from, and a report with every level, by region, goes to a spreadsheet for the bank's review.

TEAM VIEW

One tree from region to manager to team leader to staff

Numbers add up at every level

Sourced, completed, rejected, target and achievement for the cycle, per staff member, rolled up to team leader, manager and region.

History holds

Staff who moved or left still appear under the team that owned their files, so a manager's past cycle never changes after the fact.

Each manager sees their own

A team leader opens to their team, a sales manager to their teams, the business head to everything.

MANAGEMENT · DAILY DISCIPLINE

Every leader sees who is on zero and which days the team went quiet

Staff on zero

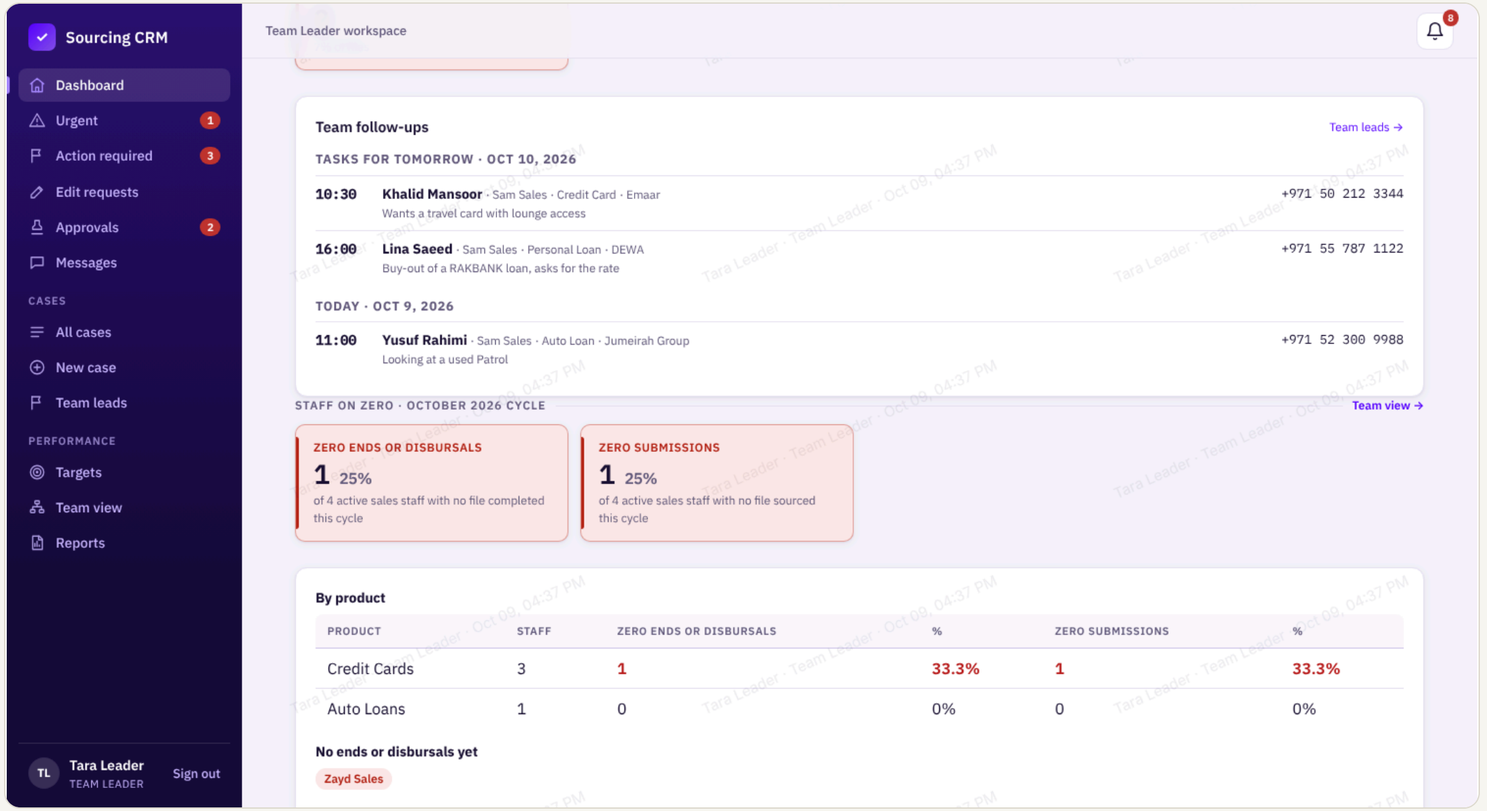

How many of the team, as a count and a share, have no end or disbursal this cycle and no submission at all, split by product and down the hierarchy, with the names highlighted and linked to their files.

The submission calendar

One cell per working day of the cycle. For a sales person, green when they submitted and red when not. For a leader, green when 70% or more of the team submitted, orange from 50%, red below. Sunday is the day off.

Why it matters

A quiet week shows the same day, not at month end. The team leader, the sales manager and the business head all read the same cells, so the conversation about a red patch starts early.

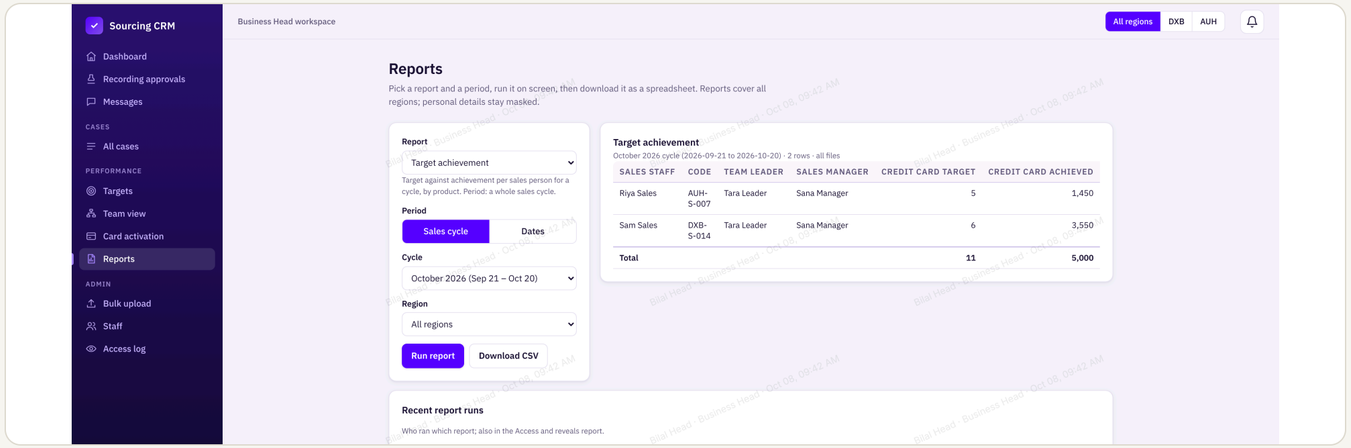

Targets come from the staff master and achievement from completed files

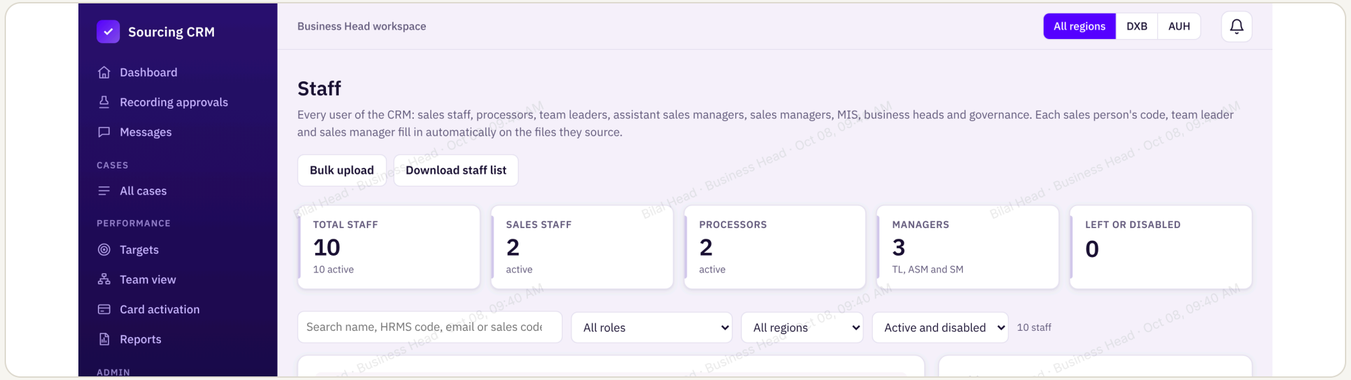

One record per staff member

HRMS code as the login, region, team leader, ASM and manager, dates of joining and leaving, salary and core product. Only MIS and the business head create or change accounts; leavers are switched off on their leaving date.

Targets by salary band

Card and auto loan targets in points, personal loan targets in disbursal value, generated for the cycle from the staff member's salary band. Achievement counts each completed file at its real points.

Each sales person sees what their open files could earn, and what the next step is worth

What is in the system

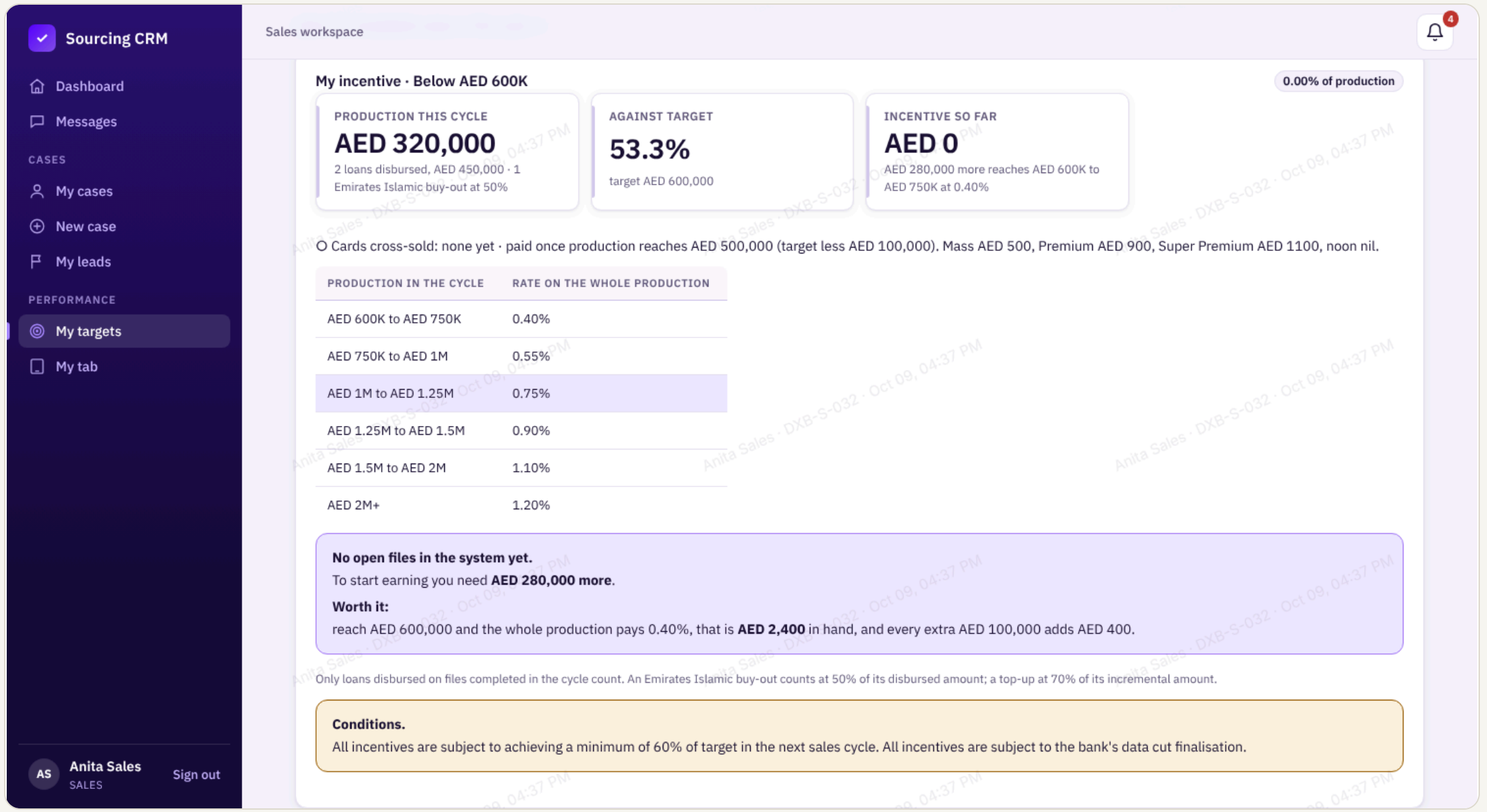

The scheme block shows how many files are still open, what they would pay if they all completed this cycle, and how much more than today that is.

How far to the money

Then the gap: the points or production still needed to start earning, from today and after those files complete, and for loan staff the next band and the card threshold.

In dirhams, not percentages

"Reach AED 600,000 and the whole production pays 0.40%, that is AED 2,400 in hand, and every extra AED 100,000 adds AED 400." The push is written for the person, in money.

SALES · BOOSTERS

A product push with dates, shown to the people it is for, with progress as it runs

Run a campaign in minutes

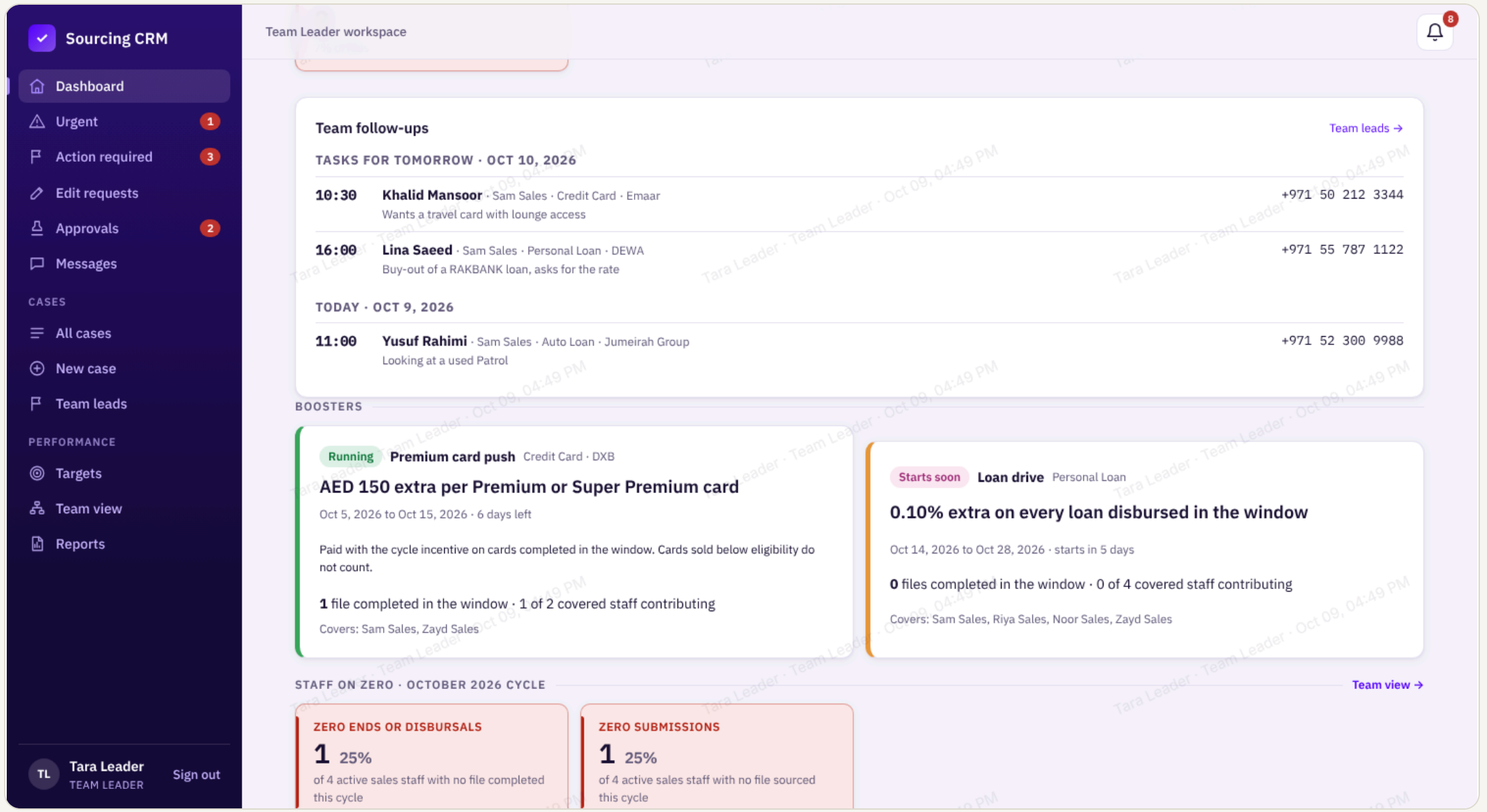

The business head or MIS names the booster, picks the product, the dates and the reward, and who it is for: both regions or one, the product's core staff or everyone, or only some teams. It can be edited, paused or deleted at any time.

Seen by exactly the right people

It appears on the dashboard of every sales person it covers and of their team leaders and managers, two weeks before it starts and while it runs, with the dates, the days left and the reward in plain words.

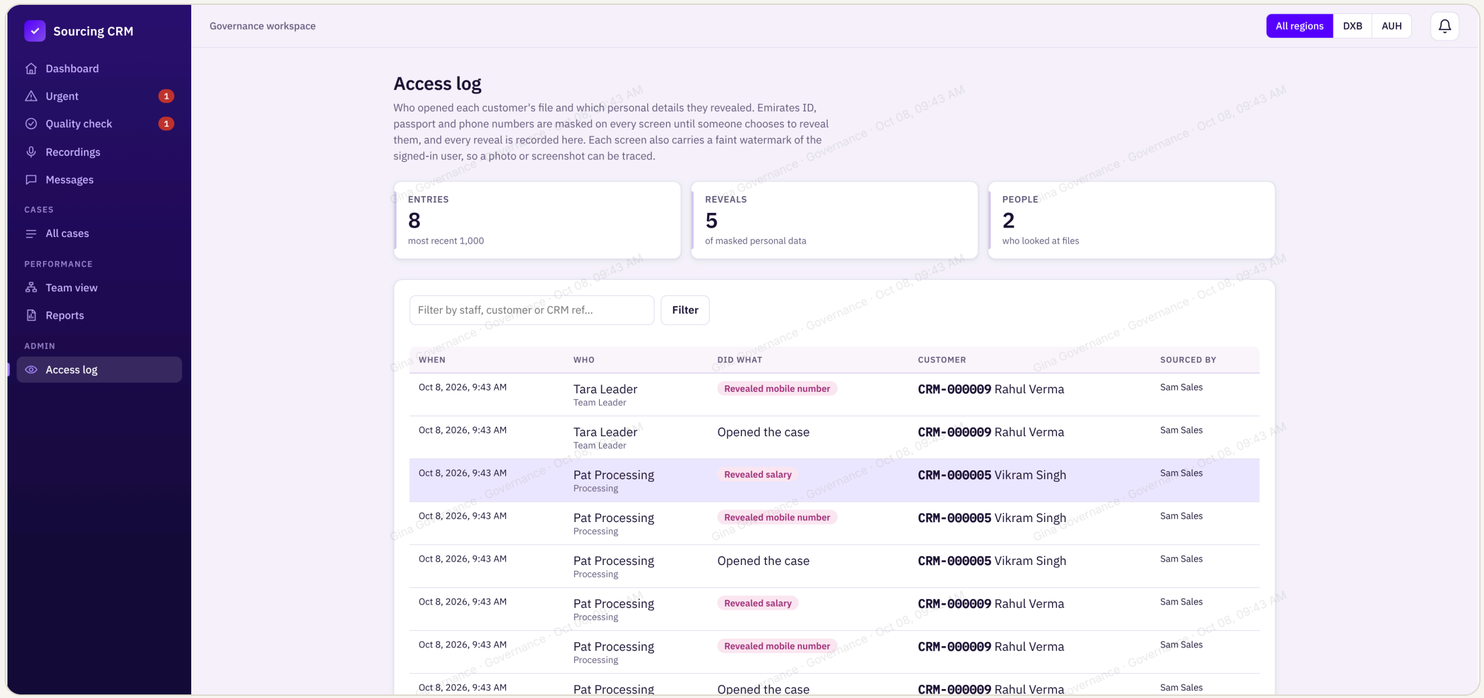

Progress while it runs

Each card counts the files completed in the window with that product, the dirhams disbursed for loans, and for leaders how many of the covered staff have contributed and who is covered. Files with a valid complaint do not count.

GOVERNANCE

Who looked at which customer, and when, without asking anyone

Access log

Every file opened, every reveal of a phone number or salary, and every report run, with the user and time. Filter by staff member, customer or file.

Governance tools

Quality checks, call scores, complaints marked valid or invalid (a valid one removes the file from incentive), urgent flags and call recording requests that the business head approves.

On our own server

One process, one database file, no outside services, with a deployment guide, backup script and environment template handed to IT.

WHERE WE ARE

Every file is checked at the point of sale, verified by a second person, and measured in points earned and points lost.

Ready

Working system with the bank's card list, payout rates, incentive schemes for staff, team leaders and managers, the 360-strong staff list and salary-band targets loaded, the verification bot with a calling service for our own SIP line, a deployment pack for IT and automated tests.

Needed to go live

Real email addresses for staff and the two business head accounts. For bot calls: the SIP line details from the provider and the two speech programs installed on the bot's server.

Parked by choice

WhatsApp alerts and integration with the bank's systems.

Questions, then the live demo
